Acquisition–episode-observation-delay trade-off

Phase-adaptive replay versus complete fixed-clock offsets and county-specific equal-budget fixed schedules

Completeness observed / possible (episode × run)	Adaptive	Fixed 1 h	Fixed 2 h	Fixed 3 h	Fixed 6 h	Fixed 12 h	Equal-budget all offsets	Equal-budget selected
Harris, TX	1/1	4/4	8/8	12/12	24/24	48/48	10/10	1/1
Duval, FL	**1/2**	8/8	**15/16**	**19/24**	**31/48**	**55/96**	**20/26**	**1/2**
Hillsborough, FL	2/2	8/8	16/16	24/24	48/48	96/96	20/20	2/2
Polk, FL	1/1	4/4	8/8	12/12	24/24	48/48	12/12	1/1

Delay panels include observed episode × run outcomes only; the matrix gives observed/all possible outcomes, so misses remain explicit. Bars span min–max and centers are medians. The filled orange square is selected only by nearest realized acquisition count (earliest-offset tie-break). Miami-Dade is coverage-only and is omitted. Delays measure threshold-observation timing, not detector accuracy. Sources: sentinel-study-tables/3 and sentinel-study-aggregate/3.
